KWSQA Talks 2025

May 28, 2025 Are you sure your APIs are secure? An introduction to API security testing with Bas Dijkstra,

See kwsqa.org

Product Assurance

Product Assurance is the process of confirming that the Product conforms to a required standard. That standard could be comprised of functional requirements,

non-functional requirements (e.g. performance) security standards or Usability (as examples).

Product Assurance is completed by an independent party who was not involved with the development of the product to ensure a bias free assessment and report. The independent party can be internal or external to the organisation but should not have had direct input into design or development.

For software products, one of the main contributors to an assessment of a product is running software tests to ensure that the product conforms to the specified standard. This is particularly critical if business decisions are based on the results generated from the product. Incorrect results can mislead people and cause issues ranging from trivial to critical. Software testing comprises a wide variety of activities from inspections to running UAT.

Schedule a no-charge two hour consultation with senior Quality Assurance consultants for an initial assessment/problem solving session.

Quality Assurance continues to be critical to resolving the above issues and getting the product and process correct the first time.

Software Quality Assurance and Testing

Achieve your software quality goals and minimize your risk.

NVP's Software Testing and QA LinkedIn Group has over 201,000 members. If you are not a member yet, you can join [here](#).

Over 5k people are active every day and the group gets up to 100 new posts per day. All posts are curated.
