QA in AI and the Test Lead

Software Testing has been impacted by the advent of AI in two ways. AI can assist in creating, executing, and reporting on tests. The tester may also be called upon to test an AI enabled system. The techniques of using AI are fairly well known. The question is what the test lead does with the provided information and how that impacts the required sign off. Join us for a free session on the questions that must be answered.

November 4, 2025 at 12:00 via Zoom.

QA - Why Bother?

If you get the feeling that this is a question you encounter a lot, you are not alone.

We get a lot of calls and emails asking us to explain this question. Of course, the answer is dependent on who is asking the question.

People want to know why they should consider it and, more importantly, the benefit.

Sometimes they are simply looking for something to carry back to the project or department.

In order to answer the question, we need to appeal to the broader costs calculated over multiple projects.

We define QA as Process Improvement and processes generally apply to multiple projects (or at least can be applied to multiple projects). Hence the need for long term measurements and metrics.

The simplest example is Defect Management. A simple process to ensure all defects are addressed and handled only once by each member of the team would remove a lot of redundancy.

Other examples include Testcase creation; Testing; Summary reporting; Development; and Requirements management. With the advent of AI, this has become much more critical to get right. The chances of going off track at high speed have increased substantially

[Book](#) a complimentary two-hour session with our senior Quality Assurance experts for an in-depth assessment and tailored problem-solving solutions.

What's New

TASSQ Talks

2025

October 21 - Derek Choy - **Enough is Enough—How to tell if there is enough visual test coverage?**
